

IUX: Integrated User Experience

Give your marketers the information and tools
they need, when and where they need it

IUX: Integrated User Experience

Give your marketers the information and tools they need, when and where they need it.

Your digital business initiatives require using many tools in concert. Today it's common to have 10s of tools like an analytics service, SEO tools, an eCommerce system, not to mention a CRM and a full marketing technology stack.

Maximize the value of all your applications and systems by showing them in one unified UI - where they can most help marketers. For example, show trends from a connected analytics platform directly on the content list in the CMS UI. Or allow the marketer to choose and place a contact form from a CRM. This is all possible in Magnolia with IUX.

Get more from your integrations

Whether it's for content, data or specific services, you most likely integrate Magnolia to other applications. Marketers wish to have an easy way of working with all of these.

IUX gives your marketers the information and tools they need, when and where they need it. With Magnolia you can connect any of the standard user interface elements in the AdminCentral backend to any of your integrated tools and systems. Additionally, Magnolia now provides IUX slots within apps where you have full control to display data, widgets or controls which connect to any of your systems.

Integrations become visual and timely. Better connected tools lead to changed behavior and processes—resulting in true digital transformation.

IUX is a set of natural places in the Magnolia UI where you can surface elements and actions from integrated applications and services.

The screenshot displays the Magnolia AdminCentral interface for editing a product. The top navigation bar includes the Magnolia logo, a search bar, and user information. The main content area is titled 'Product' and shows a form for editing a 'Leather bag'. The form includes a 'Product image' field with a preview image and an 'Upload' button. Below the image are fields for 'Product name (en)', 'SKU', 'Price', and 'Tags'. Three blue callout boxes on the right side of the interface point to specific elements: 'Product image from DAM' points to the product image, 'SKU and price from PIM' points to the SKU and price fields, and 'Automatic tags by Image Recognition Service' points to the tags field. The interface also shows a language selector (English) and 'Cancel' and 'Save changes' buttons at the bottom.

Key benefits of IUX

For Marketers:

- No more switching between many tools. Marketers have everything they need in the Magnolia UI. This reduces disruptive context switching and unnecessary clicks.
- Make data-driven decisions. Analytics and other relevant information is displayed in their UI exactly where they can most benefit from it.
- No more mistakes when the integration is easy to use: You give them 'guard rails' to keep them on the green path so that they follow your processes.
- One tool with consistent interaction patterns, and a consistent and modern look-and-feel which instills confidence.
- Information is flowing to the people who benefit from it. It's not locked in silos.
- Reduce seat-based licensing costs because marketers get the information that they need in Magnolia, and do not need to log in to the other system.

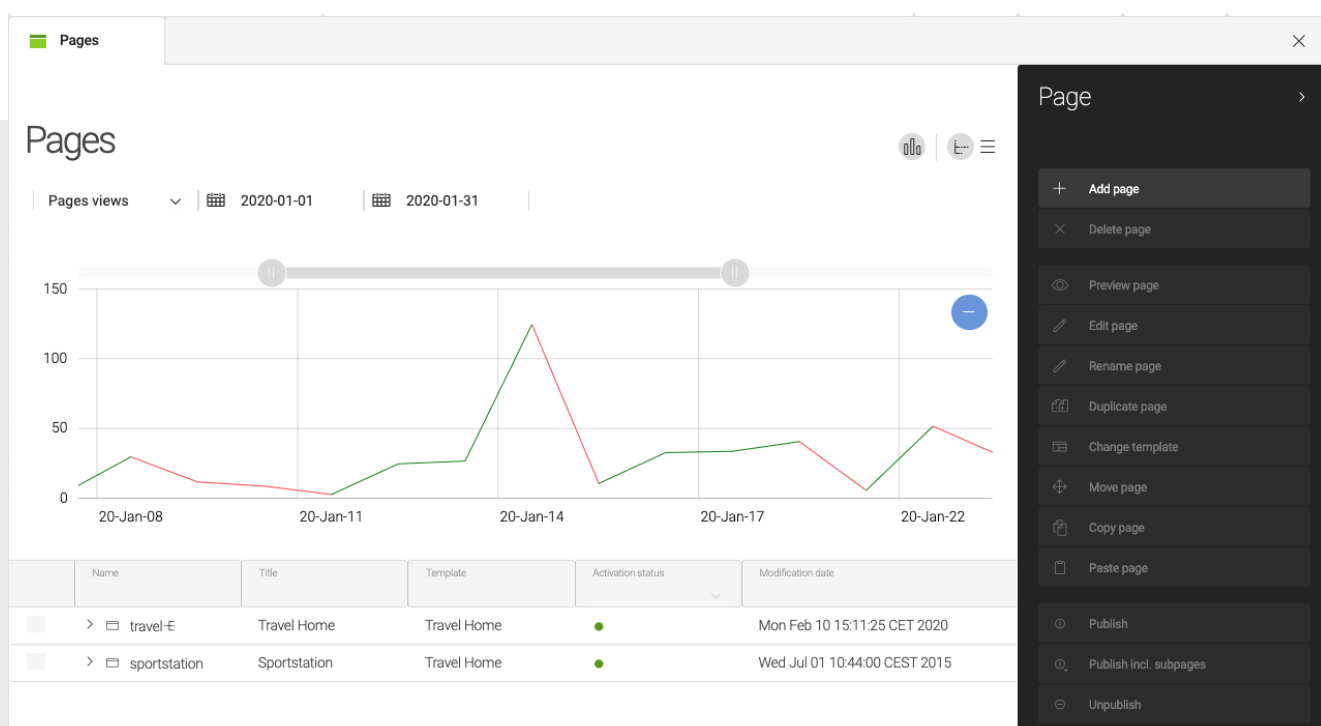

For Developers:

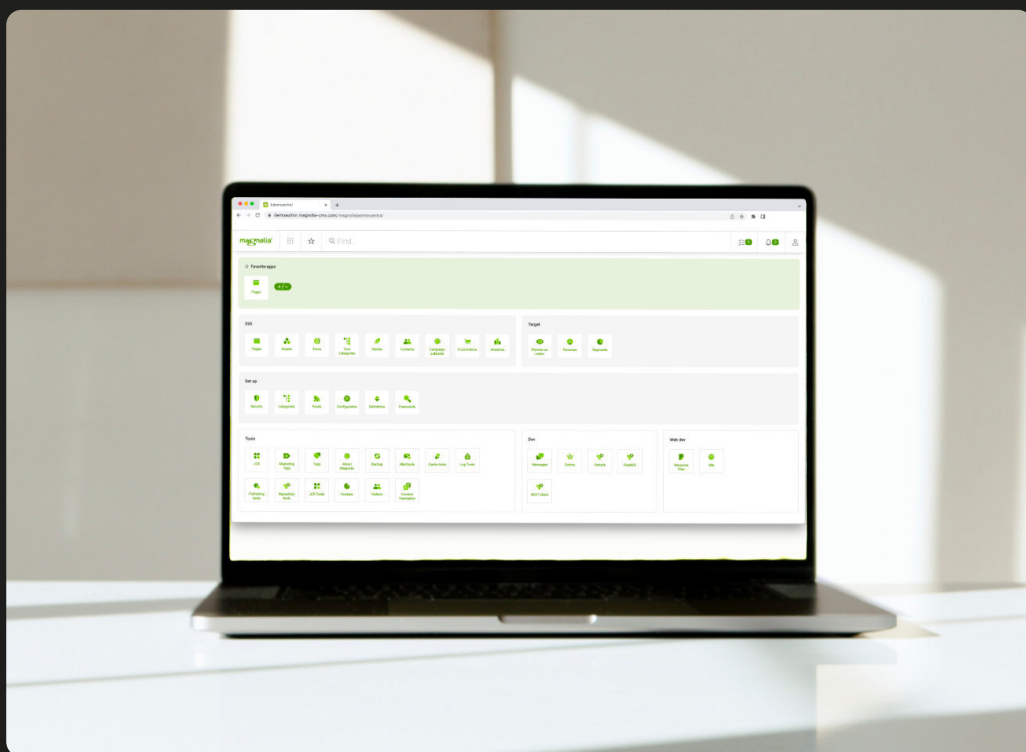

- Developers can achieve sophisticated visual integrations quickly thanks to the supported features and API.

Key capabilities of IUX

IUX slots

Magnolia apps provide an IUX slot where you have full control over what information is presented from an integration. The slot can contain content, dashboard-style graphics, widgets and can include controls to interact with the linked system. Slots are connected to the UI and can react and update based on which items are selected in the Magnolia app.
